

LEONARDO
DA VINCI

500 YEARS OF GENIUS

EDUCATION PROGRAM
SENIOR YEARS
TEACHER GUIDE

“In the normal course of events many women and men are born with remarkable talents; but occasionally, in a way that transcends nature a single person is marvelously endowed by heaven with beauty, grace and talent in such abundance that he leaves other men far behind. Everyone acknowledges that this was true of Leonardo da Vinci.”

CONTENTS

- 1) Introduction & Overview of the Exhibition
- 2) Fast Facts for Teachers
- 3) About Leonardo, His Life & Times
- 4) Da Vinci Alphabet & Codices
- 5) Introduction to His Machines, Civil Machines & Ideal City
- 6) Military Engineering
- 7) Anghiari Battle Drawings
- 8) Paintings
- 9) Father of Flight
- 10) Aquatic & Hydraulic Machines
- 11) Theater, Optics & Time
- 12) Anatomical Studies
- 13) Questions & Research Activities
- 14) The Da Vinci Challenge
- 15) Bibliography & Useful Links

1

INTRODUCTION & OVERVIEW OF THE EXHIBITION

Welcome to *Leonardo da Vinci: 500 Years of Genius*. We hope your students enjoy this celebration of one of the greatest minds of all time. The exhibition covers many subject areas and is designed to be interactive, entertaining and educational for all students.

The purpose of this guide is to help teachers maximize student experiences and learnings related to the exhibition. You will find an overview of the exhibition, background information on the subject matter and a range of activities that can be completed before, during and after your visit.

Leonardo da Vinci: 500 Years of Genius

Inventor, artist, scientist, anatomist, engineer, architect, sculptor, philosopher. Although Leonardo da Vinci died in 1519, his influence has endured. His extraordinary legacy comes to life in *Leonardo da Vinci: 500 Years of Genius*, the most comprehensive exhibition about Leonardo ever presented.

You will be introduced to Leonardo through replicas of his codices that were carefully re-created in Italy. These famous books of notes and sketches remain the primary insight into his genius. The creators of the exhibition, Grande Exhibitions of Australia, built some of Leonardo's inventions using his detailed concepts, working in collaboration with Museo Leonardo da Vinci in Rome and experts from Italy and France.

- Examine more than 70 replicas and see how Leonardo's fundamental scientific and artistic principles continue to impact the world. His inspiration laid the groundwork for many machines and devices, including the helicopter, airplane, automobile, submarine, scuba gear, and military tank.
- Explore the exclusive "Secrets of the Mona Lisa," an analysis of the iconic painting conducted at the Louvre by scientific engineer and photographer Pascal Cotte. The display features super-magnified visual examinations and the only 360-degree replica ever made of Mona Lisa.
- Become immersed in Leonardo's works through a multisensory cinematic experience using Grande Exhibitions' SENSORY4 technology. High-definition motion graphics and surround sound, combined with photography and video footage, saturate the gallery.
- Test a Leonardo-inspired catapult and create your own codex page with a self-portrait or still life.
- Encounter the Museum's historical enactors, on hand to present characters who bring a personal perspective to the story of Leonardo.

Leonardo's approach to learning was one of observation and experience. He was not formally educated, so everything he learned was self-taught. Leonardo had a relentless passion for perfection and he dared to innovate and challenge the accepted thinking and customs of his day.

Students will see and experience how Leonardo used this approach to everything he did. This discipline and approach to thinking is crucial in today's world where innovation, change and progression are central ingredients for sustained success and problem solving in science, industry, technology and medicine.

2

FAST FACTS FOR TEACHERS

Florence and Italy during Leonardo's lifetime was a difficult and dangerous place to live.

- Florence was ruled by the Church and the ruling class including the Medici Family
- Any thinking outside what was taught or believed by the Church was considered witchcraft or heresy. People were encouraged to conform to the teachings of the Church, its beliefs and values
- This era is known as The Renaissance Era (a time of rebirth and massive cultural upheaval which led to huge advancements in music, art, science and education, which challenged the conventional wisdom and thinking of the time).
- Florence is considered by many to be the Birthplace of The Renaissance Movement during this time
- War and violence was common and Warlords ruled districts in a violent and possessive manner
- Public executions were common
- Males dominated every aspect of life, whilst women lived a subservient existence
- Life expectancy for the poor was short, and outbreaks of the Plague still killed thousands every year.

Leonardo was born April 15 1452 in the town of Vinci the illegitimate son to a notary Messer Piero and a peasant woman Caterina. He lived with his father and step mother until the age of 14 when he was apprenticed to one of the most esteemed artists of his day Andrea di Cione, known as *Verrocchio* in Florence. Leonardo did his apprenticeship from 1466 to 1476. He worked with other famous painters in this Workshop such as Perugino and Botticelli. From 1476 Leonardo set off in his quest to learn everything there was to know. He was not an educated person in what was typical of the day. He did not learn Greek or Latin, or to read or learn from books. Instead he learnt through the power of observation and experience, a trait he applied in everything he did for the rest of his life. His way of recording what was happening in his world was to draw and sketch

Here are some facts on what is known about Leonardo from research:

- He was a tall man standing around 6feet and 6 inches
- He was left handed
- He was a vegetarian, and as a young man he often purchased caged birds just to release them from captivity
- He was a pacifist, even though he designed some of the most horrific killing machines for the military
- He had an insatiable curiosity to learn everything there was to know
- He wrote in mirror image, from right to left.
- He was fascinated his entire life with nature and especially birds and the concept of flight.
- In order to achieve his thirst for knowledge he needed money, hence his constant search for patrons or commissions which would help pay for his living, studio and apprentices
- He was never a rich man. Many pages in his codices have scribbled budgets where he was calculating to make ends meet.
- His friends included Machiavelli and Botticelli
- He and Michelangelo were fierce rivals and despised each other
- He aimed to perfect his art to reflect the image and the soul of his subjects
- There are very few fully authenticated art works of Leonardo da Vinci on display around the World and for some reason as a rule he did not sign his paintings
- He was often employed to produce stage shows with special effects and fireworks
- Two years before he died he suffered a stroke which affected the right side of his body
- Much of what Leonardo started he never finished. This became one of his biggest criticisms by his critics and academics.

His final years were spent in Paris at a residence next to King Francis the First. The King gave him the title of *First Painter, Architect, and Mechanic of the King*. The King left Leonardo to do as he pleased, which meant he did no painting except to finish off some work on the Mona Lisa. He spent most of his time arranging and editing his scientific studies. He died on May the 2nd 1519.

3

ABOUT LEONARDO, HIS LIFE & TIMES

(Pre Exhibition Task)

Teacher Overview:

These activities are designed specifically for students as an introduction to Leonardo da Vinci, and provide some linkage to pre exhibition preparation.

Task Sheet

- Write a summary of Leonardo and his life and times
- List a summary of his key achievements and inventions
- How was Leonardo educated?
- How did Leonardo record his observations of the World?
- Why do historians consider Leonardo to be the greatest genius of all time?
- Who were some of the key influences over Italy during Leonardo's Life & Times?
- Apart from his art, what else was unique about Leonardo?

Activity

During the 15th Century Leonardo attempted to solve many problems and every day challenges.

Research one of the following and outline how Leonardo envisaged the design working.

- a) Sink the Turkish Fleet outside Venice Harbor
- b) Attacking enemy fortifications safe from gun fire and swords
- c) Allow Man to fly without flapping like a bird
- d) Move distances without the aid of man or animal power

4

DA VINCI ALPHABET & CODICES

Teacher Overview:

Leonardo wrote using a special kind of shorthand that he adapted for himself. He used "mirror image writing", writing from right to left. Some believe this was his patent to help protect his ideas, others believe it was his way of teaching himself to write with a quill without smudging the pages. Only when he was writing for other people did he write in the normal direction. In the main he preferred to use a blood or rust colored ink and often wrote in special codes swapping numbers and letters, thus inventing his own shorthand writing style.

Leonardo's thoughts, inventions and observations are found in his handwritten manuscripts, of which over 6000 pages survive. Leonardo da Vinci's notebooks probably started out as just a way for him to improve the quality of his paintings. Somewhere along the line, however, the books became more than that. They became a record of his life-long fascination with nature and his genius for invention. After his death, his notebooks fell into the possession of his favorite apprentice Francesco Melzi, who held onto them and kept them safe until his own death in 1579. Melzi's heirs had less respect for the material, however, and sold pages off to collectors or gave them away to friends.

In 1630 Pompeo Leoni, a sculptor in the Court of the King of Spain, got hold of much of the material and tried to organize it by subject. This unfortunately resulted in the books being taken apart and the original order, which might have told us much about Leonardo's thinking, was lost. Each of the new books created by this process was a **Codex**. Presently there are ten known codices containing Leonardo's sketches. Over time most of the notebooks have found their way into various museums, archives or libraries around the world. Only one is in private hands, which is owned by Bill Gates. Two were totally unknown until 1966 when they were found by chance in the National Library of Madrid.

Clearly the notebooks were written for his own personal use. If you were able to read through them you will see a range of entries including "to do lists", budgets for the week, sketches of people's faces, notes of his thinking at a particular time, mixed with his designs and inventions.

Task Sheet:

- Locate one of Leonardo's notebooks. Look at what is written and how Leonardo wrote. See if you can write like Leonardo did. On a piece of paper write three or four lines, starting from the right hand side of the page, moving to the left.
- What is special about Leonardo's writing? On your piece of paper try and write some words like Leonardo did in his Mirror Writing.
- Where are all his notebooks today?

Activity:

Using only a piece of paper and pencil go study and observe one of Leonardo's inventions in the exhibition. Try and put as much detail as possible in the drawing along with any thoughts, notes on how it should work, just as Leonardo would have.

5

INTRODUCTION TO HIS MACHINES, CIVIL MACHINES & IDEAL CITY

Teacher Overview:

His Machines:

No field of endeavor or discipline is untouched by the hand of Leonardo, be it manufacturing, farming, transport, marine, aviation, construction and let's not forget medicine, art, or military. It is from Leonardo's notebooks that our Vincian Artisans have researched, interpreted, designed and recreated the machines on display, a feat in itself. Each model has been constructed directly from the pages of his codices. The machines are the result of fine craftsmanship. The artisans have in the main used materials readily available in the 15th Century including wood, cotton, brass, iron, canvas and chord

Civil Machines:

Leonardo was an inventor, dreamer, and innovator. Leonardo worked on many engineering projects, inventing machines to make tasks more efficient, such as lifting hoists for heavy materials, cranes, drills, and excavators for construction and development.

Ideal City:

Flooding, illness, poor sanitation, and invasion threatened and plagued Florence and Milan throughout Leonardo's lifetime. So he set out to design a city which would help solve some of these problems.

Task Sheet:

- Locate da Vinci's autotraction car and explain some of the principles behind its design, which would enable it to self propel
- What is controversial about The Bicycle
- What principles currently used in the construction industry are on display in the Civil Machines? Briefly explain the principles behind these machines
- What is unique about Leonardo's Ideal City for the time, which we now see as common practice? What were some of the problems and issues Leonardo was attempting to solve or alleviate?

Activity:

Research either da Vinci's version of the automobile or crane and explain the mechanical principles behind these designs, and compare how they relate to today's modern designs. Highlight what is similar, what is different and what was pioneering for his time.

6

MILITARY ENGINEERING

Teacher Overview

Leonardo had to grapple throughout his life with a deep personal clash of values. He was a pacifist by nature, but in his need to maintain and earn a living and support his workshop and apprentices, Leonardo had to accept commissions which paid. This meant on at least three occasions he worked for and received generous commissions from some of the most feared and ambitious war lords of the time:

- From 1482 – 1499 Ludovico Sforza, Duke of Milan
- From 1501 – 1506 the feared and much hated Cesare Borgia, the son of Pope Alexander VI!!
- In 1506 he returned to Milan to work for Maximilian Sforza

During each of these periods as Leonardo designed many of the machines of war. As a pacifist this did not sit well with Leonardo, but he was also pragmatic enough to realize he required money to pursue his true passion, his scientific research and designs. Warfare in Leonardo's time was still particularly bloody and required much close hand to hand combat, resulting in horrific injuries to all concerned. His military designs were not conventional for the time, the tank, machine gun, long range missile launches (modified cannons and catapults) and chariots were all designed to inflict maximum injury to the enemy, but at the same time preserve and protect the users.

Task Sheet:

- Why was Leonardo so uncomfortable designing these machines? Why did he agree to design Military Machines?
- Which cities was he living in when he was designing these machines, and who were they fighting?
- Look for Leonardo's bridge. How do the principles, tension and compression apply in these designs? Make a drawing or sketch and highlight how these principles are applied with Leonardo's designs. Why was Leonardo so keen to design temporary bridges?
- Have a close look at the Military Machines. Which ones for their day were truly new and innovative, and which ones were improvements on existing weapons or designs? Explain why they are either brand new innovations, or simply improvements and adaptations. Highlight what you think da Vinci was trying to achieve with the design

Activity:

Leonardo designed several types of cannons and guns. Research what was unique about them, and how they would have revolutionized warfare back then.

7

ANGHIARI BATTLE DRAWINGS

Teacher Overview

The Republic of Florence decided to create an Assembly Hall for their most important political committee, the "High Council". The majority of the construction work had been completed shortly before 1500 and it was decided to include two large wall paintings. It was planned that two important victories from recent Florentine history should be depicted: the Battle of Anghiari and the Battle of Cascina.

It was decided the two most highly esteemed Florentine artists of the age, Leonardo da Vinci and the younger Michelangelo would be commissioned to paint these wall paintings.

The up-and-coming Michelangelo (twenty-seven at the time), and the established master, Leonardo, had formed a severe dislike for each other and Leonardo seemed to consider painting alongside Michelangelo as a personal challenge. Michelangelo, for his part, called Leonardo, "the lyre-player from Milan." This was destined to be the battle of the Titans, with a third young artist popping in occasionally to review progress, this artist was Raphael, who was about 21 at the time

Both Artists set to work, one aiming to outdo the other. Both used different techniques and approaches to the artwork (Leonardo attempting a plaster approach). However, when both pictures were incomplete a huge storm damaged the Assembly Hall's walls and despite frantic attempts, both paintings were damaged irreparably, and hence destroyed.

As neither of the two artists completed their works, we only know of their projects through documents and sketches that have been associated with the project. Leonardo's caricature sketches capture vividly the terror and aggression of soldiers through the fighting, and the ferocity of infuriated horses. He spent a great deal of time studying the movements of animals and researching faces, recording them in sketch form in preparation for painting them on the giant walls of the Assembly Hall.

Task Sheet

- When was the Battle of Anghiari commissioned? Who were the two painters commissioned?
- Why is this piece of work considered unique and important
- What happened and how were the pictures destroyed?

Activity:

Research how Leonardo and Michelangelo went about their work. How did they differ? Why did they dislike each other? How did Michelangelo live his life? Who was another younger artist who would observe both artists approaches, and go on to become another giant name in the Renaissance period?

8

PAINTINGS

Teacher Overview:

For over 400 hundred years da Vinci's enormous fame rested on his achievements as a painter through a handful of works. These are regarded as among the most supreme masterpieces ever created. There are three 3D animations on display which explain in quite detail the Vitruvian Man, Last Supper and the giant Horse Sculpture

One of the distinguishing features of Renaissance art was its trend towards realism. To that end, painters developed new techniques, studying light, shadow, and, famously in the case of Leonardo da Vinci, human anatomy. Leonardo, Michelangelo and Raphael are three artists from this era who have become legends. All three shared life and times together.

Da Vinci's painting are famous for a variety of qualities and innovative techniques that he used including:

- the laying on the paint
- his detailed knowledge of anatomy
- the use of light, botany and geology
- his interest in the way in which humans register emotion in expression and gesture
- his innovative use of the human form
- his use of the subtle gradation of tone

There is much debate in the art world over which paintings are entirely by Leonardo, and those which simply have his hand in the picture. Leonardo was so busy with all his pursuits, he would often get bored or find it difficult to finish anything in a timely manner, but the demands of patrons / customers often meant he would need to get others to finish. To complicate matters more, Leonardo would seldom sign his work for reasons unknown, but his distinctive style, eye for detail and innovative techniques often made it easy to identify one of his paintings.

Leonardo was a perfectionist when it came to his art, constantly revising and touching up his works of art over long periods of time. He would study characters for hours, even days researching and aiming to capture their every mood and emotion. He believed art was a blend of science, math, experimentation and observation.

Task sheet

- List paintings which academics agree are exclusively Leonardo da Vinci's
- What was unique about Leonardo's style and approach to painting
- Explain how Leonardo approached his work with *The Last Supper*? What was unique about his approach? Why is it considered a masterpiece? Why has it required constant restoration over the years?
- Who were some other great artists of this time? Who did Leonardo despise?

Activity:

Research one of Leonardo's art pieces and record:

- When it was painted
- Who it was painted for
- An outline of what the painting represents
- Why it is considered important
- Special innovations, techniques and approaches Leonardo applied to the picture

9

FATHER OF FLIGHT

Teacher Overview:

Right from an early age Leonardo was fascinated with birds and fascinated with flight. This is one area of his work where he actually built and experimented with some of his designs. Whilst studying and observing how birds flew, Leonardo began to study and research the science and principles of wind, air, and atmospheric pressure. His early work in the area of flight focused on his belief that humans could replicate the movements of Birds. Later through his anatomical research he realized that humans would never have the upper body strength to fly, so he turned his attention to the art of gliding.

Task Sheet

- Leonardo's early work in flight focused on what principles and methodologies? How did this differ from his later work in Flight?
- Specifically which birds and insects did Leonardo observe and study to gain his inspiration for his designs on flight?
- Two of the designs on display have been recently trialed. Both worked but required modifications. Which were the machines in question? Who trialed them and when? What modifications were made in order to make them safely work?
- What are some of the machines on display used to research and understand the principles of wind, air and atmospheric pressure? Why was this important?
- Make a sketch of the aerial screw and label the key elements and principles key to its effective design

Activity:

Take one of Leonardo's flight designs and create a timeline of how it progressed from Leonardo's design to today's modern version. Specifically look at the parachute, helicopter, modern day jets and planes, or weather instruments. The time graph should include key milestones and innovations, dates, key people and current applications

10

AQUATIC & HYDRAULIC MACHINES

Teacher Overview:

Much of Leonardo's work in Milan and Florence was concentrated around his continual work with aquatic and hydraulic principles, where he looked at innovative ways of dealing with key issues of the time such as how to raise and drain water (Archimedes Screw) to reduce the threat of flooding which played havoc with both cities. He was fascinated with the movement of water all his life. One of his major projects was to attempt to divert the Arno River in order to link Florence with the Sea.

In 1500 Venice was in major conflict with Turkey. Leonardo went to the ruling Venice Council with a bold plan to convince them to commit to an unconventional war to sink the Turkish fleet, via a war under water. He submitted his drawings of a submarine, aqua lung and a range of aquatic military devices. The Council dismissed his plans as unworkable but did employ Leonardo as an engineer, to devise a system of moveable floating barricades to protect the city from attack.

Task Sheet:

- How did Leonardo envisage his underwater designs would work? What were they? For what purposes would these designs be used?
- Can you find a machine which was used to raise water? How did it work?

Activity:

Research how the principles of Archimedes' screw are applied in today's modern world. Pay particular attention to how the design principles are applied across a range of different applications.

11

THEATER, OPTICS & TIME

Teacher Overview:

Leonardo was creatively very talented. He was an accomplished musician, singer and actor, and produced many spectacular stage plays which were renowned for their special effects. Leonardo's time pieces are particularly of interest. He was fascinated with the measurement of time, and the challenge for accuracy and continuity. His work explores and links many scientific disciplines into his time machines: Physics, mechanics (springs, weights and gears), geometry and carpentry.

Leonardo considered music second only to painting among the creative arts. He applied mechanical theory and acoustic observations in his designs for new instruments including the portable piano, double flute and mechanical drum.

He was interested in optics, especially the effect of light, reflection, shadows and magnification. This led to him designing a range of mirrors, spotlights and special lenses which could be applied across a range of disciplines including his art work, stage productions and astronomy interests.

Task Sheet:

- Locate Leonardo's time piece and pay close attention to how it worked. What are some of the mechanical principles behind the design?
- Why do some people draw comparisons between Leonardo da Vinci and Stephen Spielberg of Hollywood fame?

Activity:

What is less known about da Vinci is his work in optics. Research some of the principles and designs Leonardo pursued here. What was he trying to achieve and what was he interested in? How are these principles applied in today's world?

12

ANATOMICAL STUDIES

Teacher Overview:

It is in this area of study the conviction and courage of Leonardo stands out. At this time the Vatican denounced any unholy practice, such as the cutting up of bodies. Indeed they considered Leonardo's work bordering on witchcraft and heresy, especially as his notes were written in what was considered a *strange scripture*, his mirror image writing. The Vatican eventually forced Leonardo to stop this practice around 1512, and much of his 200 sketches were lost, only to be rediscovered many years after his death

Leonardo saw the body as a wonderful, compact machine capable of achieving a range of movements. He dissected and drew the bodies of more than thirty men and women of all ages in order to understand the function, proportion and mechanics of the body. This practice was forbidden by the Catholic Church and eventually he was banned from doing any further research.

Leonardo would closely observe and record the effects of age and emotion on the physiology of people, in particular the effects of rage. In fact it is widely reported that it was Leonardo who first discovered atherosclerosis or hardening of the arteries. Today's medical profession has links back to Leonardo da Vinci, with his precise groundbreaking anatomical drawings, his physiological investigations, and his research into the effects of ageing.

Task Sheet:

- Look closely at the anatomical drawings by Leonardo. Choose one and record what it relates to, what it uncovers and highlights.
- Leonardo is recognized as being the first person to identify a common disease. Can you work out which disease and what he thought was the cause?
- Why did Leonardo commence and pursue his work in anatomy? What was he hoping to achieve?

Activity:

Leonardo combined his artistic talent with his technical precision with his Anatomical Drawings. Research how he went about doing this task, where and in what time periods. Outline why it was stopped and by who? List some of the ground breaking areas he researched and what he discovered.

13

QUESTIONS & RESEARCH ACTIVITIES

1. Where was Leonardo Born? Make a photocopy of his birth place from a map of the world and color the area.

A: 15 April 1452 in Anchiano, near Vinci, Tuscany, Italy.

2. What information can you give about Italy and Florence around the time Leonardo was born? Did people follow a religion? Was it a peaceful place to live?

A: Florence and Italy during Leonardo's lifetime was a difficult and dangerous place to live.

- Florence was ruled by the Church and the ruling class including the Medici Family
- Any thinking outside what was taught or believed by the Church was considered witchcraft or heresy. People were encouraged to conform to the teachings of the Church, its beliefs and values
- This era is known as The Renaissance Era (a time of rebirth and massive cultural upheaval which lead to huge advancements in music, art, science and education, which challenged the conventional wisdom and thinking of the time).
- Florence is considered by many historians to be the Birthplace of The Renaissance Movement during this time
- War and violence was common and Warlords ruled districts in a violent and possessive manner
- Public executions were common
- Males dominated every aspect of life, whilst women lived a subservient existence
- Life expectancy for the poor was short, and outbreaks of the Plague still killed thousands every year.

3. What is known about Leonardo's mother? What was her name?

A: She was a young peasant woman named Caterina. She wasn't married to Leonardo's father. She eventually married a lime burner, moved to a neighboring village and had five more children.

4. What information can you provide about Leonardo's father?

A: He was a local lawyer and notary, named Messer Piero. Leonardo's father married four times and had eleven children.

5. What formal education did Leonardo receive whilst growing up? What was his approach to learning which he applied throughout his life?

A: Nil, he was self taught. Through observation and experience

6. What was the name of the famous painter who invited Leonardo to be an apprentice in his studio?

A: Andrea del Verrocchio.

7. What is the name of the painting that Leonardo was invited to contribute to in 1471?

A: Baptism of Christ.

8. What technique did Leonardo use when he worked on this painting? How did this differ from his master's technique?

A: The painting features both Tempera and Oil painting techniques. His master used tempera, mixing powdered pigment with egg yolk, wine, vinegar and water applied in a series of quick drying layers to build up the desired shades. Leonardo used the newer style using oil paint, which was easier to apply and allowed the artist to create more subtle shading. The colors were magnificent and da Vinci's contribution to the piece of art became the focus of attraction for the eye.

9. Where and when did Leonardo die and what was his only painting on his possession?

A: France, Paris, May the 2nd 1519 in the arms of King Francis the 1st. He had the Mona Lisa with him

10. How tall was Leonardo and what do we know about him?

A: He was tall (about 6'6") left handed, a vegetarian who enjoyed the company of men. He was a pacifist

12. Leonardo during the course of his anatomical work commenced the first early research on what common disease? What did he surmise it was caused by?

A: Atherosclerosis (hardening of the arteries), caused by age and stress (rage)

15. In 1499 Leonardo leaves Milan and his job working for Ludovico. Why?

A: Milan was invaded by the French and he was forced to leave.

16. How old is Leonardo when he arrives at Venice?

A: Leonardo was 48 years old.

17. What is threatening the stability of Venice and how can Leonardo's designs help?

A: An invasion by a fleet of Turkish war ships threatens Venice. Leonardo has designs for a crack team of divers who can sink the fleet of ships. The invention of SCUBA is evident here where Leonardo envisaged divers to walk the sea bed unnoticed, using self contained underwater breathing apparatus (SCUBA) and lay harm to the enemy ship's hull

18. Who is the Mona Lisa?

A: The true identity of the woman pictured in the portrait remains unknown, despite intensive research by art historians. Many believe the Mona Lisa to be a portrait of Lisa Gherardini Giocondo, the wife of a wealthy Florentine merchant, Francesco del Giocondo. (Thus the Mona Lisa is known in Italy as La Gioconda.) Others have suggested the subject was a mistress of da Vinci, or even a self-portrait, or a combination of people into the one portrait.

19. How long does it take Leonardo to complete his painting of the Mona Lisa?

A: It is known that Leonardo began the portrait in Florence in 1503, continued work on it through 1506, and then kept the painting until his death in 1519. Some believe he carried it with him for so many years as it was never really completed.

20. What is a fresco?

A: A fresco comes from the Greek Φρέσκο *fresko* which in turn derives from *affresco* Latin or *fresco* ("fresh"), which has Germanic origins. Fresco paintings can be done in two ways: *Buon fresco* paintings are done on wet plaster, while *secco paintings* are completed on dried plaster. The former is usually the more authentic form.

21. Why do Leonardo's frescoes 'The Last Supper' and 'The Battle of Anghiari' not survive the test of time very well?

A: Leonardo painted *The Last Supper* on a dry wall rather than on wet plaster, so it is not a true fresco. Because a fresco cannot be modified as the artist works, Leonardo instead chose to seal the stone wall with a layer of pitch, gesso and mastic, and then paint onto the sealing layer with tempera. Because of the method used, the piece has not withstood time very well – within several years of completion it already began showing signs of deterioration. A similar fate befell the Anghiari battle fresco, after a huge storm damaged the walls.

22. How old is Leonardo when he begins work on the canal project of the River Arno and what problem is he solving with his canal project and who has commissioned him?

A: Leonardo intended on building a system of canals that would make the Arno River navigable from Florence to the sea. He was 52 at the time

23. What type of machines is it recorded that Leonardo actually unsuccessfully trialed in 1496?

A: One of his flying machines

24. In 1506, who controls Milan and who does Leonardo work for now?

A: The French governor, Charles d'Amboise controls Milan and Leonardo now works for King Louis XII.

25. In 1513 where does Leonardo work and what projects does he undertake?

A: Leonardo is working at the Vatican in Rome and makes plans for the port of Civitavecchia.

26. Who does Leonardo leave his manuscripts and instruments to?

A: His pupil, Francesco Melzi.

27. Which paintings does he leave to his pupil Salai?

A: The Mona Lisa, Saint Jerome and Saint Anne.

28. Where was Leonardo buried?

A: He was buried in the town of Amboise in the cloister of the church of Saint Florentine. His ashes were then scattered as a result of the Wars of Religion

29. Why did Leonardo move from one employer to another so frequently?

A: In general because he received a paid engagement from employers, but rarely completed the work, frustrating his employers to the point of them not renewing contracts with him. Leonardo also grew tired of people who did not understand the magnitude of his "additional discoveries" and new knowledge, thus leaving little room for compatibility in the long term.

30. How many are Leonardo's manuscripts and where are they generally kept? Which one is in private hands and by whom?

A. There are 10 codices held in museums and galleries around the World. One, Codex Leicester is owned by Bill Gates

31. Who is the Vitruvian Man sketch by Leonardo da Vinci named after? What is the theory of divine proportions?

A. The Roman Architect Vitruvius

It was made as a study of the proportions of the (male) human body as by the Ancient Roman architect Vitruvius, who wrote that in the human body:

- a palm is the width of four fingers
- a foot is the width of four palms
- a cubit is the width of six palms
- a man's height is four cubits (and thus 24 palms)
- a pace is four cubits
- the length of a man's outspread arms is equal to his height
- the distance from the hairline to the bottom of the chin is one-tenth of a man's height
- the distance from the top of the head to the bottom of the chin is one-eighth of a man's height
- the maximum width of the shoulders is a quarter of a man's height
- the distance from the elbow to the tip of the hand is one-fifth of a man's height
- the distance from the elbow to the armpit is one-eighth of a man's height
- the length of the hand is one-tenth of a man's height
- the distance from the bottom of the chin to the nose is one-third of the length of the head
- the distance from the hairline to the eyebrows is one-third of the length of the face
- the length of the ear is one-third of the length of the face

THE DA VINCI CHALLENGE

Here are challenges for students to do while at the exhibition.

- 1) Can you locate 10 Da Vinci Design Inventions which are currently commonly in use today? You will need to record the design invention and its codex number (which are on the explanation panel)

Da Vinci Design Invention and Codex Number	Today's Current Use
1)	1)
2)	2)
3)	3)
4)	4)
5)	5)
6)	6)
7)	7)
8)	8)
9)	9)
10)	10)

- 2) Who is La Gioconda?
- 3) If Peter is number 5 and Mathew is number 10, what does that make Simon? What is this referring to?
- 4) What is the height of a man in both cubits? And then in palms?
Cubits =
Palms =
- 5) This has been owned by the British Royal Family since 1690. Da Vinci used it between 1478 and 1518. What is it specifically?
- 6) Who was hired along with Leonardo da Vinci to create two huge wall fresco's in Florence's City Parliament the Palazzo della Signoria? What were the frescos of? Who was doing what?
- 7) Explain what the Vite Aerea is. What is its name in English? What is this the forerunner to? What children's game is this design linked to?
- 8) What is 55 X 40 cm and can be found in the Czartoryski Museum in Krakow Poland?

- 9) Locate the following and complete the table, recording the appropriate codex, codex number or machine number

Codex	Codex Number	Machine Name (English)
	F.1 R.	
		Slope Meter
	F. 54 R.	
	B, F. 28 R.	
		Automatic Blocking Mechanism

Answers:

Question	Answer
1	Individual answers
2	Mona Lisa
3	Last Supper Picture, Simon is the 12 th Disciple moving from left to Right (he is far Right)
4	Four Cubits; Six Palms
5	Codex Windsor
6	Michelangelo who did the Battle of Cascina; Da Vinci who did Battle of Anghiari
7	Aerial Screw, forerunner to Helicopter, and game children played then was 'Whirligigs'
8	The Lady of the Ermine Painting
9	Atlantico F 1 R Odometer Atlantico F. 381 R. Slope Meter Arundel F. 54 R. Ogival Bullet Manoscritto B.F. 28 R. Mirrors Room Madrid I. F. 12 R. Automatic Blocking Mechanism
